About Me

I'm a fullstack software engineer with over 3+ years of Experience, specializing in building robust backend systems, intuitive frontend interfaces, and Agentic AI solutions. I'm passionate about creating scalable, maintainable software that blends performance with usability, while also integrating cutting-edge AI workflows. My work spans the entire stack, with a strong foundation in backend development and autonomous AI systems—building tools and automations that are both efficient and impactful.

Currently, I'm working as a Software Engineer at Folio3, specializing in Backend and AI engineering. I contribute to the development of AI powered solutions and scalable backend systems for a variety of clients and internal products, ensuring they meet industry standards and follow best practices in software engineering.

I have hands-on experience in AI development, including building solutions using Langchain, LangGraph, MCP servers, and TensorFlow. My recent work includes designing Agentic AI workflows, implementing RAG-based systems, and fine-tuning local LLMs for specialized use cases.

In my spare time, I enjoy playing football, experimenting with new tech ideas, and staying updated with the latest in software and AI advancements. I'm always exploring innovative ways to bridge practical problems with modern engineering solutions.

Experience

June 2024 — PRESENT

Software Engineer · Folio3

At Folio3, my experience as a Software Engineer has centered around building AI-powered mobile and web applications from the ground up. I work on integrating intelligent features that enhance user experience, backed by robust backend systems built with NestJS, .NET, and deployed on the AWS cloud platform.

On the AI side, I've worked on model fine-tuning and building Retrieval-Augmented Generation (RAG) systems tailored to specific client needs. I've worked extensively with LangGraph, LangChain, OpenAI, and Pinecone, leveraging these tools to build agentic workflows and scalable AI-driven solutions. Collaborating closely with cross-functional teams, I help ensure our applications are technically sound, scalable, and aligned with both product and business objectives.

Recently, I developed a FastAPI-based MCP server with real-time WebSocket support for managing multiple AI agents, including orchestration, config generation, and support for tools like Slack, GitHub, and Jira.

2023 — 2024

Trainee Software Engineer · Folio3

During my trainee period, I contributed to a range of projects across departments like Digital Health and App Development, with a strong emphasis on AI-driven solutions. I gained hands-on experience working with technology stacks such as React Native, the MERN stack, and various AI frameworks. My training included getting familiar with backend development and AI concepts, where I worked on fine-tuning models and building intelligent features that enhanced system efficiency and user engagement.
